intro.block Feedback control system block diagrams

- 1 As we have already seen, a useful tool for designing control systems is the block diagram. The plant and the controller are represented as blocks. Usually a transfer function (or transfer function matrix) can describe the function of each block. A typical block diagram is shown in Fig. def.1.
- In this configuration, a command function R(s) is provided to the control system. The feedback H(s)Y(s) is subtracted from R(s) to give the error E(s). This is fed to the controller C(s). The output of the controller is the control effort U(s), which is the input of the plant C(s). The output Y(s), after being fed back as H(s)Y(s), is what the control system is attempting to make equal to the command R(s), therefore, ideally E(s) = 0.
- 3 Block diagrams express algebraic relationships. (The blocks do not dynamically "load" each other.) In the case of Fig. def.2, the relationships are

$$E(s) = R(s) - F(s) \tag{1a}$$

$$U(s) = C(s)E(s) \tag{1b}$$

$$Y(s) = G(s)U(s) \tag{1c}$$

$$F(s) = H(s)Y(s). \tag{1d}$$

The closed-loop transfer function is defined as Y(s)/R(s). This important transfer function shows how the system should respond to commands, of key importance for most performance criteria.

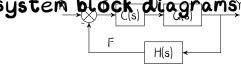

Figure block.1: a block diagram for a controller C(s).

Figure block.2: a block diagram with the corresponding closed-loop transfer function block, derived in Example intro.block-1.

closed-loop tranfer function

Example intro.block-1

Given the feedback block diagram of Fig. def.1 (left), solve for the closed loop transfer function Y(s)/R(s).

re: Closed-loop transfer function
